Trường hợp không biết phương sai của tập đối tượng gốc

Các thay đổi so với Z-test: Tiêu chuẩn kiểm định

$$Z = \frac{\left(\overline{X} - \mu_0\right)\sqrt{n}}{\sigma}$$

σ^2 cho trước từ tập gốc

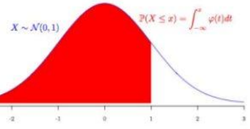

$$T = \frac{\left(\overline{X} - \mu_0\right)\sqrt{n}}{S}$$

S^2: Độ lệch chuẩn hiệu chỉnh được tính từ tập mẫu

Phương sai tổng thể vs phương sai mẫu hiệu chỉnh

Population Variance	Sample Variance
$\sigma^2 = \frac{\sum_{i=1}^{N}(x_i - \mu)^2}{N}$	$s^2 = \frac{\sum_{i=1}^{n}(x_i - \bar{x})^2}{n-1}$
σ^2 = population variance x_i = value of ith element μ = population mean N = population size	s^2 = sample variance x_i = value of ith element $\bar{x}$ = sample mean n = sample size
